OBS Logistics Showcases Warehouse Operations Dashboard at IMHX

7 February 2013 - Warehouse and Transport Management Software Specialist, OBS Logistics, returns to IMHX 2013 to showcase *CALIDUS* Vision, the operational dashboard that provides up to the minute situational awareness for warehouse activity in real-time.

Efficiency improvements of between 10% and 20% have been achieved by customers currently using the software. *CALIDUS* Vision offers multiple standard views, as well as additional bespoke views, that monitor warehouse throughput and productivity against a defined set of measurement criteria. The system will trigger alerts if there is a risk that deadlines may be missed and gives advance warning for a range of other potential issues in time to take remedial action.

Warehouse managers can use the dashboard to help determine if it is necessary to re-allocate operatives and to manage the labour resources in line with changing demand from the customer order pool.

CALIDUS Vision is a fully RF and Voice enabled solution which displays key performance data across the entire warehouse operation in real-time. It integrates seamlessly with the *CALIDUS* WMS warehouse management software that helps improve efficiencies from goods receipt to final delivery for multi-warehouse operations.
